Arturo builds and sells two types of steel tables. The revenue Arturo generates from selling each square table is 2 times his cost to build a square table, and the revenue Arturo generates from selling each hexagonal table is 2.5 times his cost to build a hexagonal table. In one year, Arturo's total cost to build tables was $\$42,120$, and he generated a total revenue of $\$101,250$ from selling all the tables he built that year. For that year, how much greater is the revenue Arturo generated from selling hexagonal tables than the revenue he generated from selling square tables?

(A) $\$16,200$

(B) $\$25,920$

(C) $\$59,130$

(D) $\$68,850$

$$7x + 8y = 3$$

The given equation is one equation in a system of two linear equations. If the system of equations has at least one solution, which of the following equations could be the other equation in the system?

I. $10.5x + 12y = 4.5$
II. $10.5x - 12y = 4.5$

(A) II only

(B) Neither I nor II

(C) I and II

(D) I only
